

[ASCET] How to use an array as message

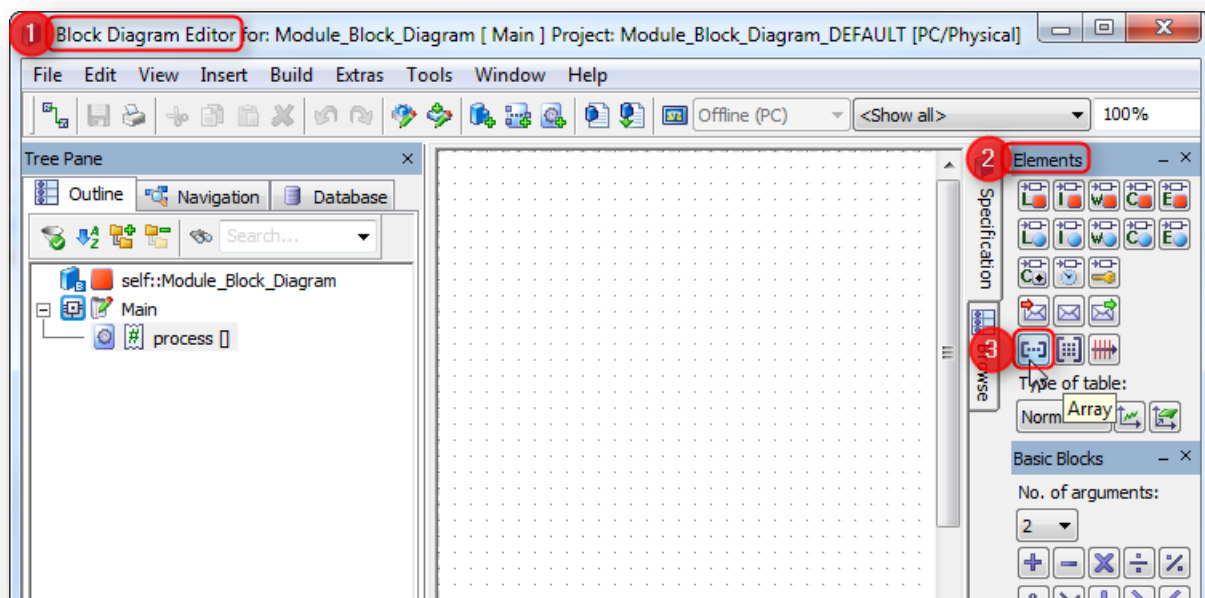

Question:

- How to use an array as message?
- Is it possible to use an array as message?
- How to use non-scalar messages?
- How to create a non-scalar message, i.e. a message of array, matrix or record type?

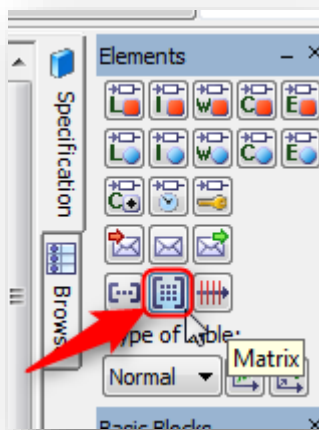

Answer:

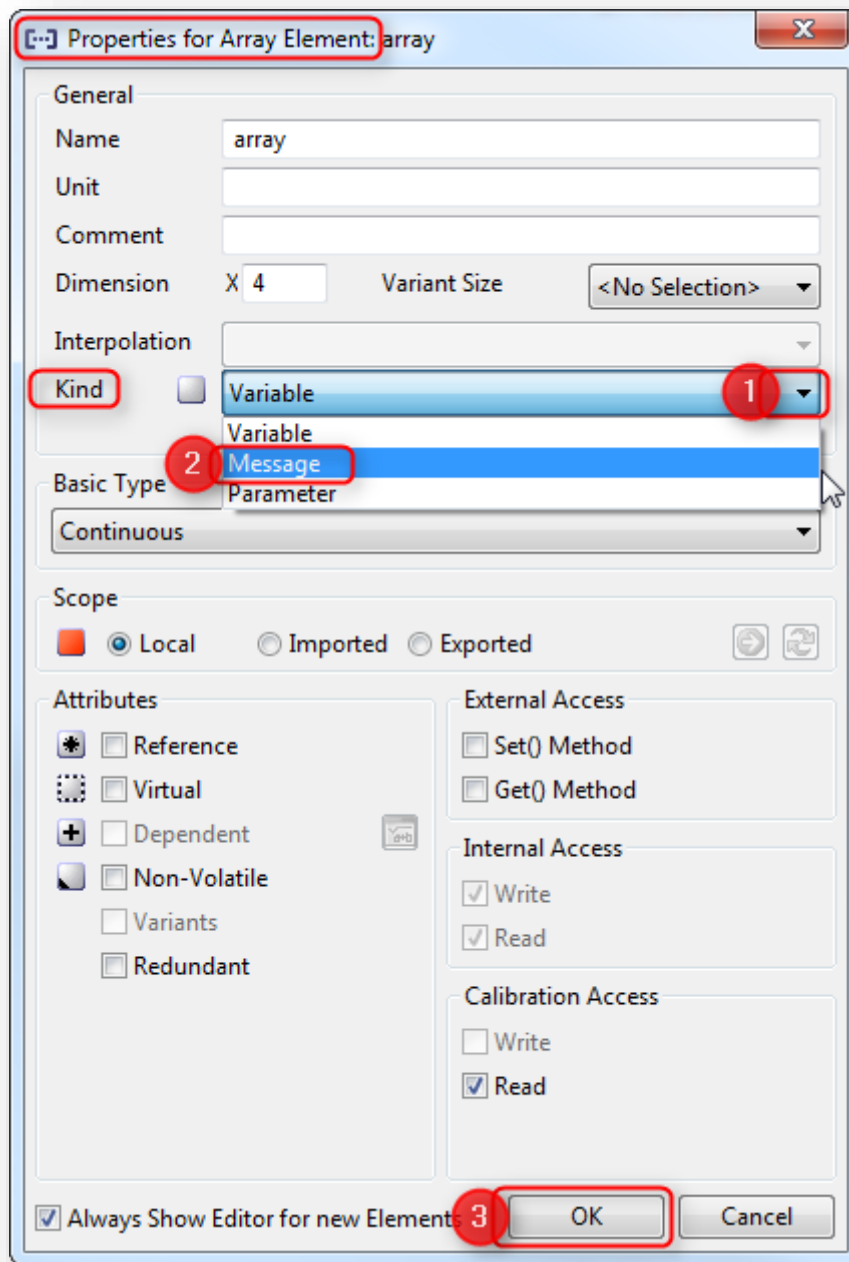

- This is possible with **ASCET V6.4** and newer versions
- In **ASCET** in **Block diagram editor**: Create an array or matrix, or include a record
 - Array

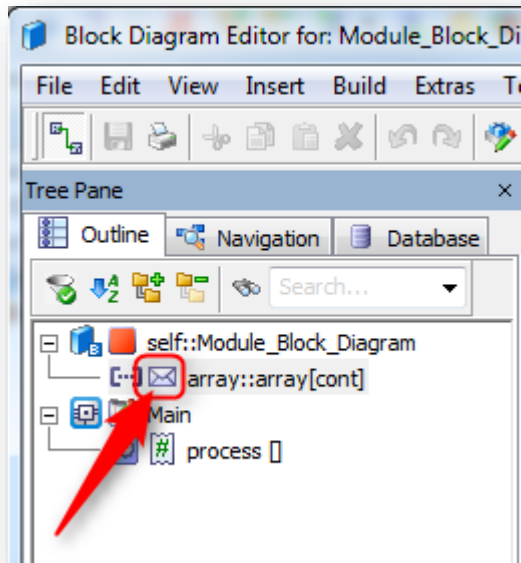

- Matrix

- Record: Include a record manually or via the block library
- In the **Properties for ... Element** editor at field **Kind**: Left mouse button click on **black triangle**, then click on **Message**

- Finally, click **OK** button

- The array, matrix or record is now a message
- The **Internal Access** area of the properties editor is changed accordingly
- The **Reference** option is deactivated and disabled
- If you want to: Select scope of the message in the **Properties** editor at field **Scope**
 - Messages with scope **Local** are always **SendReceive** messages
 - Use the options in the **Internal Access** area to fine-tune the kind of an imported or exported message
 - Activate one or both options
 - It is not possible to deactivate both options at the same time
- You can change the properties of a message later via re-opening the properties editor

Additional information:

- Workaround for older ASCET versions
 - Use a global array, matrix or record
 - **WARNING:**
 - Global variables are not protected variables in preemptive scheduling
 - If two concurrent processes both access the same global variable, data consistency cannot be guaranteed
